## 1 一些常用不等式

### 定理 1.1: 均值不等式

对于任意的正数  $a_1, a_2, \dots, a_n$ , 都有

$$\frac{a_1 + a_2 + \dots + a_n}{n} \geq \sqrt[n]{a_1 a_2 \dots a_n}.$$

证明. (1) 向前数学归纳法:

归纳假设:

设  $P(n)$  为命题 “对于任意的正数  $a_1, a_2, \dots, a_n$ , 都有

$$\frac{a_1 + a_2 + \dots + a_n}{n} \geq \sqrt[n]{a_1 a_2 \dots a_n}.$$

基例:

$n = 1$  时, 显然成立.

假设:

假设  $P(2^k)$  成立, 即对于任意的正数  $a_1, a_2, \dots, a_{2^k}$ , 都有

$$\frac{a_1 + a_2 + \dots + a_{2^k}}{2^k} \geq \sqrt[2^k]{a_1 a_2 \dots a_{2^k}}.$$

那么对于  $n = 2^{k+1}$ , 我们有

$$\frac{a_1 + a_2 + \dots + a_{2^k} + a_{2^k+1}}{2^{k+1}} = \frac{a_1 + a_2 + \dots + a_{2^k} + a_{2^k+1}}{2} \cdot \frac{a_1 + a_2 + \dots + a_{2^k} + a_{2^k+1}}{2^k} \geq \sqrt[2^{k+1}]{a_1 a_2 \dots a_{2^k} a_{2^k+1}}.$$

因此, 命题  $P(n)$  对任意正整数  $n$  成立.  $\square$

But this immediately implies the following corollary:

推论 1.1. *Riemann's Every non-trivial zero of the Riemann  $\zeta$  function has real part one-half.*

Which we can demonstrate with an example:

### 例题 1.1: Poincare

Consider a simply connected, closed 3-manifold. Notice that it is homeomorphic to the 3-sphere!

引理 1.1. *This is a lemma.*

命题 1.1. *This is a proposition.*

注记. This is a note.

**定义 1.1: Limit of a function**

If, for every  $\epsilon > 0$  there exists some  $\delta > 0$  such  $0 < x - a < \delta$  implies  $|f(x) - L| < \epsilon$  then we say that the function  $f$  has a limit of  $L$  at  $a$  and we write

$$\lim_{x \rightarrow a} f(x) = L.$$
